

# Zomato Dataset Analysis Report

This report presents a concise summary of the Zomato analysis, including the main charts, the coding approach, and the insights gained from the dataset.

## About the charts

The restaurant-type chart shows that casual dining and quick-bite outlets dominate the dataset. The cuisine chart highlights the most common food styles, while the location chart shows where restaurants are concentrated. The rating and cost charts reveal that most venues cluster around mid-range pricing and positive ratings.

## About the code

The notebook loads the Zomato CSV, removes duplicate and invalid values, and cleans rating and cost fields before analysis. It then generates bar charts and histograms to explore restaurant types, cuisines, locations, costs, and ratings. A statistical comparison is included to check whether online-ordering restaurants differ in rating from those without online ordering.

## Visual summary

### Zomato Dataset Analysis

#### Notebook Preview

- Data cleaning and EDA completed
- Charts and statistical insights generated
- Executive summary prepared for stakeholders

Restaurant analysis shows strong concentration in casual dining, quick bites, and a few major locations.
